Type 2839-1V(D) to 2842-1V(D) PVDF Conductivity Electrodes

Product description

The type 2839-1V(D) to 2842-1V(D) Conductivity/Resistivity Electrodes are available in four cell constants from 0.01 to 10.0 cm⁻¹, and are suitable for a wide variety of applications from high purity water quality monitoring to weak acids and bases. 316 SS electrode surface finishes are controlled in a precision bead blasting operation to ensure measurement accuracy and repeatability.

The PVDF insulator and process connections are injection over-molded to minimize variance between electrodes. Double threaded connections in either 3/4 in. NPT or ISO 7/1-R 3/4 enable quick and easy installation in submersible or in-line configurations.

Transmitter integral mounting kit and junction boxes are available as accessories.

A Certificate of Calibration is included with all 2839-1V(D) to 2842-1V(D) conductivity/Resistivity Electrodes. The electrodes are calibrated to meet $\pm 2\%$ accuracy.

The certificate includes calculated cell constant and temperature offset which when entered into the „custom cell“ menu of any GF meter would provide a 2% accuracy of the sensors reading. Electrodes can be shipped back to the GF factory for recertification.

Features

- $\pm 2\%$ accuracy - Custom calibration certificate provided
- Dual-threaded for in-line, submersible, or integral mount for 2850 sensor electronics

* Although these electrodes look similar in design, there is an inherent difference. From the bottom view, the 2841 electrode features a simple plastic insert. However, the 2842 electrode features a complex plastic insert with four holes through which liquid flows.

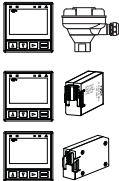

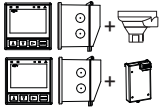

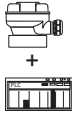

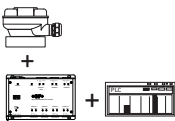

Integral Mount Sensor

The 2839-2842 Dual Threaded Conductivity Electrodes can form an Integral Mount System with the 3-9900-1 GF Transmitter when using the 3-9900.396 Direct Conductivity Module, angle adapter and the 8052 Integral Mount Kit. Complete Integral Mount System with 9900 transmitter are available through our Specials program.

Application Tips

- To optimize 9950-10 /-11 I/O module selection, you can utilize 2850-63 for two conductivity sensors at a time.
- Liquid levels must be high enough to cover vent hole on sensor body.
- Install sensors in an area that will remain free of air bubbles and sediment build-up.
- Conductivity measurements are affected if electrodes are coated by process substances.

Note

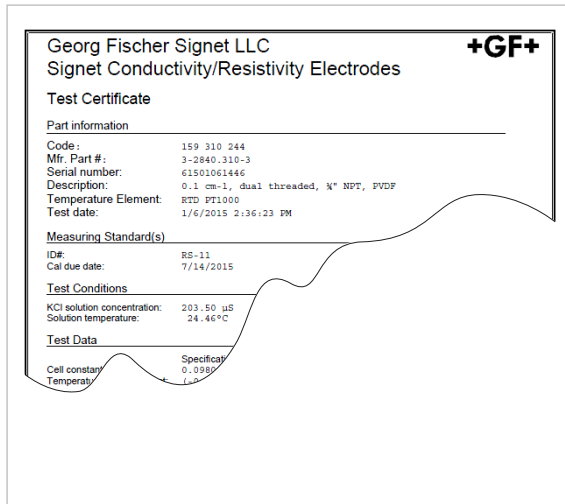

The pressure-temperature diagrams are specifically for the GF sensor. During system design the specifications of all components must be considered. In the case of a metal piping system, a plastic sensor will reduce the system specification.
